Good evening.

Dave, Steve wants you to think about a low water crossing possibly with a drop structure up where North Fork crosses the road at the base of the Gold King waste dump. The intent is to avoid the road washing out during spring runoff. He'd also like you to consider what should be done at the North Fork/Cement Creek confluence and at the North Fork/county road crossing. This e-mail is just a trigger for you and Steve so you remember to talk about this tomorrow.

Elliott, could you or one of the others please take photos of the key points in each of the reclamation areas tomorrow. Pictures along the streambank and other areas most vulnerable to erosion are important. I'll come up Monday and we can hopefully finish things up then.

I also need soil samples, probably 2, from the reclamation areas. Do composites of similar type materials. For example, if there is a deep rich looking soil that's dominant in one area and a sandier or more tailings like soil in another area, take one of each. We'll need a gallon zip lock bag mostly full for each sample. Double bag it with the second one zipped on the opposite end. If Dave R. is still there, maybe he can do a paste pH on each sample. And XRF metals. Then we'll send them for agronomic analysis and possibly acid base account depending on the paste pH and visual characteristics. I'll work on the lab information and analyte list.

Do we have a shovel at the site? If not, let me know and I'll bring one.

Let's talk or text later or in the morning and we can discuss these items.

Jan
